ANALOGUE ACTUATORS

Analogue actuators are generally low-priced to mid-priced items, and most of them are equipped with inexpensive components. The motor is always a D.C. brushed unit. Actuators offer no user-programmable options. Communication is always based on a PWM signal with a frequency of 50Hz. The motor PWM is the same as the control frequency, i.e. it is also 50Hz. This means that the possibility to control activity (motor on or motor off) only occurs every 20ms. Slow movements or small corrections result in long motor-off periods in relation to motor-on periods. The motor voltage is always the same as the power supply voltage.

Advantages:

- Reasonable price
- Pleasant running sound thanks to low motor frequency
- Low power consumption

Disadvantages:

- Low holding moment
- Slow response characteristics
- Low resolution due to low control frequency
- Wide deadband (20ms)
- Slow movements may not be smooth

DIGITAL ACTUATORS

Digital actuators generally fall in the high mid-range to high-price category. Very high-quality components may be used, such as Hall sensors for position sensing, as well as brushless D.C. motors. Communication is based on a PWM signal with frequencies up to 330Hz (according to actuator type) or other interfaces such as CAN, UAVCAN, RS-485 or TTL. The motor frequency is independent of the control system and is usually in the range 300 - 500Hz. This results in a very small possible deadband of up to 2ms. Digital actuators also offer wide-ranging programming and protective functions, as well as allowing two-way communication (feedback) depending on type.

Advantages:

- Fast response characteristics
- Fast corrective activity
- High holding power
- User-variable deadband
- Good accuracy
- Two-way communication
- Programmability
- Safety functions
- High resolution

Disadvantages:

- In most cases more expensive
- In some cases unpleasant running sound due to high motor frequency
- Higher power consumption

INTERFACES

PWM communication

The conventional method of controlling Hitec actuators, with many advantages for simple tasks. Hitec PWM actuators can be controlled using a pulse width of 900 to 2100µs. The usual control frequency is 50Hz (20ms), but frequencies up to 330Hz are possible with particular actuator types for special applications.

Actuators with PWM communication can easily be controlled at low cost, and they are adequate for many applications where feedback is not required.

The interface is in widespread use, and many controllers offer suitable presets and libraries.

CAN and UAVCAN communication

The industrial and UAV field is becoming increasingly significant. This progressive, fast and technically highly complex market demands innovation and reliability. Many applications require intelligent solutions and genuine feedback of position, torque and other parameters in order to assess the application or to gain information about the condition of the components.

The following protocols are available: CAN 2.0A, CAN 2.0B, DRONECAN, UAVCAN

* Can be supplied fitted with the client's choice of connectors upon request.

RS485 and TTL communication

There are a number of applications in several fields of operation for which feedback of the actual servo position is required, or at least desirable. Certain Hitec actuators are also available with RS485 and TTL interfaces, which enable them to work with two-way communication (feedback).

Hitec RS485 and TTL actuators communicate with external devices using the half-duplex process. TTL actuators of this type feature just one signal wire in addition to the voltage and earth conductors, where as RS485 actuators feature two signal wires.

FEATURE OVERVIEW

Mid-point and end-point adjustment (EPA / Neutral Settings)

Provides programmable mid-point and end-point servo positions.

Direction of rotation

Clockwise (CW) = when viewed from above, the servo output rotates clockwise when the signal width is increased.

Counter-Clockwise (CCW) = when viewed from above, the servo output rotates counter-clockwise when the signal width is increased.

Deadband (DB width)

The smaller the deadband, the sooner any corrective activity takes place when an angular change occurs. If the deadband is too low for the application, the result will be increased wear. Increasing the deadband results in loss of precision.

Travel speed

The servo's transit speed: 100% equates to maximum possible travel speed.

ID-read / Node-ID

Assignment of an actuator ID in TTL and CAN networks.

Fail Safe

If the signal is lost, the servo rotates to a pre-selected position.

Fail Safe limp mode

The servo goes into sleep mode: the motor is disabled and the servo position is not maintained. The servo can be moved by hand.

Soft Start setting

When switched on, the servo runs to the nominal position at low speed in order to minimise stress on the gearbox and peripherals. At the 100% setting the servo runs to the nominal position with maximum transit speed when switched on.

Overload protection

Protection mechanism designed to avoid damage to the servo if it is overloaded or stalled. A setting of 20% corresponds to a reduction in maximum torque by 80%.

Smart sense

An intelligent regulatory circuit adjusts the control parameters while the servo is in use, in order to reduce oscillation. Oscillation can be provoked by fluctuating inertia levels in the various applications.

It is also possible to influence the regulatory circuit manually (sensitivity ratio settings). A high value may result in high-speed oscillation at the servo. A low value may generate severely damped response characteristics.

*: Several rotations are possible for maximum angular travel.
**: The servo is capable of continuous rotation.

TWO-WAY COMMUNICATION (FEEDBACK)

Absolute position

The control system no longer has to rely on an actuator actually taking up the desired position; instead its current position can be read off with a resolution of 4096 steps.

Torque

Torque is a particularly important feature, as it allows the user to make assessments of the actual loads when the actuator is in use, as well as the condition of the components. Stiff mechanical systems can be detected and corrected in good time before they result in actuator overload. The torque value is derived from the motor PWM, and is therefore not an actual measurement, but it is adequately precise for the majority of applications.

Speed

How fast is the actuator when actually in use by the application? The actuator itself supplies the answer, thereby permitting important inferences to be drawn for many a control task.

Power supply voltage

The actuator constantly provides information on the momentary power supply voltage. The development or maintenance team can use this to detect potential weak points in the cable loom, for example: enabling high-resistance connectors to be replaced in good time.

Current drain

Current is the most important feedback element in preventing potential damage. Rising current over a given period of operation under a constant load is a reliable indication of an imminent fault. This may relate to the motor, the gearbox or the mechanical system being moved. Monitoring current drain opens up new possibilities in programming: effective system life can be extended by targeted optimisation of the internal control system (PID) and other parameters such as Soft Start (ramp) or deadband.

Micro-controller temperature

The temperature of the micro-controller is more than just a useful piece of information. Environmental conditions which include wide thermal variation can be very demanding on an actuator. Monitoring temperature in this way allows the development team to learn the thermal limits of the product, and to introduce appropriate measures to prevent premature failure.

Motor temperature

Are you asking too much of the actuator you are using? The motor temperature provides reliable information on whether an actuator is being operated close to its limit. This feedback is very important, especially if thermal conditions are widely variable.

Cycle counter

How many cycles does the actuator complete during use? How many parts were positioned? When must the actuator be replaced because the maximum cycle count has been reached? Some of our actuators supply this feedback in a convenient manner as part of the protocol.

MOTORTYPES OVERVIEW

Brushed Motor

Brushed DC motors are characterized primarily by their low price, but also by their high overload capacity (good heat dissipation). These motors are mainly used in analog servos. They are a first choice for applications with lower performance requirements or a relatively low number of cycles (e.g. locking mechanisms). The disadvantages are, in addition to the wear and tear of the sliders, an increased cogging torque and lower efficiency. The motor ramp-up time (acceleration) is between 22 and 40ms, depending on the type.

Coreless Motor

These extremely efficient motors (no cyclic magnetization losses) impress with very fast motor ramp-up times (acceleration) of just 7 to 11ms and high power delivery. Due to their design, (iron-)coreless motors have no cogging torque, which is reflected in smooth engine running. The wear is low and relates only to the conductor, which is used for commutation, and the bearings. A disadvantage is the low overload capacity of the coreless design, due to poor heat dissipation. Coreless motors therefore recommended for use in more demanding applications, where there are also occasional rest phases between cycles to allow cooling, or for control and regulation tasks in the low load range.

Brushless Motor

Powerful BLDC motors combine many advantages of modern drive technology and are almost wear-free (no sliders). In addition to high efficiency and smooth running, sensor-controlled brushless motors also offer a fast motor ramp-up time (acceleration) of just 11 to 14 ms and high torque right from a standing start. In contrast to coreless motors, good heat dissipation is provided via the laminated core, which minimizes thermal problems during continuous operation. These motors are highly recommended for demanding applications with frequent corrective measures. Most high-load actuators are therefore equipped with BLDC motors.

PROGRAMMING DEVICES

Hitec digital actuators offer the ability to adjust various settings and activate safety features. These parameters can be changed using various programming devices.

HFP-30

The Hitec HFP-30 offers extensive configuration options and test functions. Its compact dimensions make it ideal for mobile use, as it does not require a computer. The HFP-30 can be used to program all Hitec digital PWM actuators.

DPC-11

The Hitec DPC-11 is a cost-effective programming interface for use with a computer running Windows. All settings can be easily modified and optionally saved. This allows, for example, the selected settings to be easily archived or transferred to other servos. The connection is via USB.

DPC-CAN

The Hitec DPC-CAN interface allows you to configure, update, or test Hitec CAN and UAVCAN servos. Various software applications are available for this purpose. A computer with a Windows operating system is required. The connection is via USB.

SERVO OUTPUT ARMS

A wide range of output arms is available for the entire Hitec servo portfolio.

Servos usually come with a selection of suitable output arms.

For special requests, you can choose from our wide range; please contact us.
